System requirements

System requirements refer to a checklist of minimum necessary items for a [computer](#) to have. These items would be requirements in order for an [operating system](#) to work, such as [Windows XP](#). If the system did not have these things, the computer or operating system might crash or cause problems. If it exceeds minimum expectations, you could check the **recommended system requirements**, and see if it also meets those. If it does not, it is not bad. But if it does meet the recommended requirements, that is very good to [know](#).

This [short article](#) about [technology](#) can be made longer. You can help Wikipedia by [adding to it](#).
